

Core Banking Systems 101

A Core Banking System (Centralised Online Real-time Environment) is the application banks use to support their most common transactions — covering CRM, new account openings, loan creation and servicing, withdrawals, payments, deposits, account management, and interest rate calculation.

These applications allow banks to deliver services across multiple channels including internet banking, ATMs and branches. Depending on the type of institution — retail, securities trading or wholesale — the Core Banking functions differ to suit individual business needs.

Universal systems such as Avaloq and Temenos T24 can facilitate multiple functions simultaneously, making them the platform of choice for large international institutions. Demand for Core Banking system specialists is growing rapidly across Europe, APAC, the Middle East and the United States.

The Market

Australia emerged as a key growth market in early 2019, driven by rising T24 adoption. Clients across all regions are involved in multiple upgrades annually, creating sustained demand for experienced consultants who can help institutions keep pace with system evolution.
